Linux is a clone of UNIX, the multi-user operating system which can be accessed by many users simultaneously.Linux can also be used in mainframes and servers without any modifications. But this raises security concerns as an unsolicited or malign user can corrupt, change or remove crucial data.For effective security, Linux divides authorization into 2 levels.

**File Permissions in Linux/Unix with Example**

Description. killall sends a signal to all processes running any of the specified commands. If no signal name is specified, SIGTERM is sent. Signals can be specified either by name (e.g., -HUP or -SIGHUP) or by number (e.g., -1) or by option -s. If the command name is not a regular expression (option -r) and contains a slash (/), processes executing that particular file will be selected for ...
